DAILY MONITORING
The data is collected from the shop as customers make transactions and is captured through the POS system.
The collected data is stored in the shop's database for future access and analysis.
The data is transferred from the shop's database to the data warehouse for storage and analysis.
Databricks is used as the data warehouse where the data is stored, processed, and prepared for analysis.
Data processing takes place in Databricks, where SQL is used to clean, transform, and prepare the data for analysis.
The processed data is extracted from Databricks and exported to Excel for further analysis and reporting.
We use Excel to create graphs, tables, and charts to visualize the data and make it easier to analyze and interpret.
The findings are presented in Canva or PowerPoint to management and stakeholders, highlighting key insights and supporting informed business
A dashboard is created using Power BI or Data Studio to continuously monitor sales performance and track key trends.
